

To-Do

- Create function to remove entries from ingredient table
- Determine structure of & create table for recipes
 - Start with 2-3 known recipes & test table structure
 - Flesh out recipe entry (how to allow for 1-by-1 ingredient inputs)
- Clean up/fortify user input in entry function (reject invalid inputs, clean up formatting, etc.)
- How to use/combine information from ingredient table & recipe table
- Create script/function to allow for ingredient cost calculations
 - Where/how to source price info (maybe not rely on user input price)?
